

- C7 (3340 pin 11) = film/poly cap ideally lower value like 680pF, but dont have
- ZD = 10V zener diode - don't think I have?
- 22uF electro caps can be 10-100uF but must be >25V
- dont have to put in the extra CV or the 1V/Oct CV parallel out, but might be nice
- not sure about how the hard sync should be wired up? the white leads might just go to ground
